

Advanced Programming

CSE 201

Instructor: Sambuddho

(Semester: Monsoon 2024)

Week 2 - Classes and Objects – Basics

Classes and Objects.

- Defining your own class:

```
class ClassName
{
    field1
    field2
    . . .
    constructor1
    constructor2
    . . .
    method1
    method2
    . . .
}
```

```
class Employee
{
    // instance fields
    private String name;
    private double salary;
    private LocalDate hireDay;

    // constructor
    public Employee(String n, double s, int year, int month, int day)
    {
        name = n;
        salary = s;
        hireDay = LocalDate.of(year, month, day);
    }

    // a method
    public String getName()
    {
        return name;
    }

    // more methods
    . . .
}
```

Classes and Objects.

- Defining your own class:

-

- Array of objects:

-

```
Employee[] staff = new Employee[3];
```

```
staff[0] = new Employee("Carl Cracker", . . .);
```

```
staff[1] = new Employee("Harry Hacker", . . .);
```

```
staff[2] = new Employee("Tony Tester", . . .);
```

Class with main() method should *ideally* be different from the class whose objects it uses.

Classes and Objects.

```
import java.time.*;

/**
 * This program tests the Employee class.
 * @version 1.13 2018-04-10
 * @author Cay Horstmann
 */
public class EmployeeTest
{
    public static void main(String[] args)
    {
        // fill the staff array with three Employee objects
        Employee[] staff = new Employee[3];

        staff[0] = new Employee("Carl Cracker", 75000, 1987, 12, 15);
        staff[1] = new Employee("Harry Hacker", 50000, 1989, 10, 1);
        staff[2] = new Employee("Tony Tester", 40000, 1990, 3, 15);

        // raise everyone's salary by 5%
        for (Employee e : staff)
            e.raiseSalary(5);

        // print out information about all Employee objects
        for (Employee e : staff)
            System.out.println("name=" + e.getName() + ",salary=" + e.getSalary() + ",hireDay="
                               + e.getHireDay());
    }
}

class Employee
{
    private String name;
    private double salary;
    private LocalDate hireDay;

    public Employee(String n, double s, int year, int month, int day)
    {
        name = n;
        salary = s;
        hireDay = LocalDate.of(year, month, day);
    }

    public String getName()
    {
        return name;
    }
}
```

Private/Public Methods and Variables

- – Unlike C/C++ all methods and variables are public.
- – To make a class visible to the JVM and other files you must declare it as `public`.
- – All public classes need their respective files.
- – Non-public (private) class need not have their own files.

Private/Public Methods and Variables

- **Final** keyword
 - – **final** type field (define and initialize in the beginning and use as many times as you like without reassigning or changing it).
- – Can be used for normal variable as well as class object variables.
- **Private** keyword
 - – **Private** keyword for class members - cannot be accessed through objects. Can only be accessed by class methods.

Static Methods and Variables

- Static keyword
 - – Philosophy: Have a single instance of a class object, variable, method etc.
 - – Class variable with 'static' keyword - Can be used without the class object only with the class name only.
 - – Only *one* variable shared across all objects of the class.

Static Methods and Variables

- `Static` constants
- `static final`

```
public class Math
{
    . . .
    public static final double PI = 3.14159265358979323846;
    . . .
}
```

Constructors and Constructor Overloading

- – Called when the class object is created.
- – Explicit constructor vs implicit.
- Implicit: Default when there are no explicit constructors.
- Explicit: Function with same name as class and no return values. Can have any number of arguments.
- – Constructor overloading: Multiple constructors with the same name, differing only wrt the args.

Initializations

- – Constructor(s).
- – Value initialization at declaration time.
- – Value *initialization block*.

```
class Employee
{
    private static int nextId;

    private int id;
    private String name;
    private double salary;

    // object initialization block
    {
```

- – *no read before*
- *initilization.*

```
        id = nextId;
        nextId++;
    }

    public Employee(String n, double s)
    {
        name = n;
        salary = s;
    }

    public Employee()
    {
        name = "";
        salary = 0;
    }
    . . .
}
```

Packages and Imports

- Collection of classes - *package*.
- – *Packaged* in a directory.
- – Packages are clustered in a directory structure.
- – Classes with same name can reside inside their respective *packages*. No conflict.
- – Classname can be a fully qualified classname:
 - `java.time.LocalDate`
 - OR
 - Implicit based on the imported packages:
 - `import java.time.*;`
 - `LocalDate today = LocalDate.now();`

What is Memory?

- Memory (system memory, not disk or other peripheral devices) is the hardware in which computers store information, both temporary and permanent
- Think of memory as a list of slots; each slot holds information (e.g., a local `int` variable, or a reference to an instance of a class)
- Here, two references are stored in memory: one to a `Dog` instance, and one to a `DogGroomer` instance

//Elsewhere in the program

```
Petshop petSmart = new Petshop();
```

```
public class PetShop {
```

```
    public PetShop() {  
        this.testGroomer();  
    }
```

```
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new  
        DogGroomer();  
        groomer.groom(django);  
    }
```

Objects as Parameters: Under the Hood (1/6)

```
public class PetShop {  
  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
    }  
}
```

```
public class DogGroomer {  
  
    public DogGroomer() {  
        // this is the constructor!  
    }  
  
    public void groom(Dog shaggyDog) {  
        // code that grooms shaggyDog goes here  
    }  
}
```

Somewhere in memory...

Objects as Parameters: Under the Hood (2/6)

```
public class PetShop {
```

```
    public PetShop() {  
        this.testGroomer();  
    }
```

```
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
    }
```

```
public class DogGroomer {
```

```
    public DogGroomer() {  
        // this is the constructor!  
    }
```

```
    public void groom(Dog shaggyDog) {  
        // code that grooms shaggyDog goes here!  
    }
```

Somewhere in memory...

When we instantiate a

Dog , he's stored somewhere in memory. Our

PetShop will use the

Objects as Parameters: Under the Hood (3/6)

```
public class PetShop {  
  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
    }  
}
```

```
public class DogGroomer {  
  
    public DogGroomer() {  
        // this is the constructor!  
    }  
  
    public void groom(Dog shaggyDog) {  
        // code that grooms shaggyDog goes here!  
    }  
}
```

Somewhere in memory...

The same goes for the

DogGroomer

—we store a particular

DogGroomer

somewhere in

Objects as Parameters: Under the Hood (4/6)

```
public class PetShop {  
  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
    }  
}
```

```
public class DogGroomer {  
  
    public DogGroomer() {  
        // this is the constructor!  
    }  
  
    public void groom(Dog shaggyDog) {  
        // code that grooms shaggyDog goes here!  
    }  
}
```

Somewhere in memory...

We call the `groom` method on our `DogGroomer`, `groomer`. We need to tell her which `Dog` to

Objects as Parameters: Under the Hood (5/6)

```
public class PetShop {  
  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
    }  
}
```

```
public class DogGroomer {  
  
    public DogGroomer() {  
        // this is the constructor!  
    }  
  
    public void groom(Dog shaggyDog) {  
        // code that grooms shaggyDog goes here!  
    }  
}
```

Somewhere in memory...

Objects as Parameters: Under the Hood (6/6)

```
public class PetShop {  
  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
    }  
}
```

```
public class DogGroomer {  
  
    public DogGroomer() {  
        // this is the constructor!  
    }  
  
    public void groom(Dog shaggyDog) {  
        // code that grooms shaggyDog goes here!  
    }  
}
```

Somewhere in memory...

The groom method doesn't really care which

Dog it's told to groom—no matter what another

Variable Reassignment: Under the Hood (1/5)

```
public class PetShop {  
  
    /* This is the constructor! */  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
        django = new Dog();  
        groomer.groom(django);  
    }  
}
```

Variable Reassignment: Under the Hood (2/5)

```
public class PetShop {  
  
    /* This is the constructor! */  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
        django = new Dog();  
        groomer.groom(django);  
    }  
}
```

Variable Reassignment: Under the Hood (3/5)

```
public class PetShop {  
  
    /* This is the constructor! */  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
        django = new Dog();  
        groomer.groom(django);  
    }  
}
```

Local Variables (1/2)

- All variables we've seen so far have been **local variables**: variables declared *within a method*
- Problem: the **scope** of a local variable (where it is known and can be accessed) is limited to its own method—it cannot be accessed from anywhere else
 - the same is true of method parameters

```
public class PetShop {
```

```
    /* This is the constructor! */
```

```
    public PetShop() {
```

```
        this.testGroomer();
```

```
    }
```

```
    public void testGroomer() {
```

```
        Dog django = new Dog();
```

```
        DogGroomer groomer = new DogGroomer();
```

```
        groomer.groom(django);
```

```
        django = new Dog();
```

```
        groomer.groom(django);
```

```
    }
```

```
}
```

local variables

Local Variables (2/2)

- We created `groomer` and `django` in our `PetShop` 's helper method, but as far as the rest of the class is concerned, they don't exist
- What happens to `django` after the method is executed?
 - "Garbage Collection"

```
public class PetShop {
```

```
    /* This is the constructor! */
```

```
    public PetShop() {
```

```
        this.testGroomer();
```

```
    }
```

```
    public void testGroomer() {
```

```
        Dog django = new Dog();
```

```
        DogGroomer groomer = new DogGroomer();
```

```
        groomer.groom(django);
```

```
        django = new Dog();
```

```
        groomer.groom(django);
```

```
    }
```

```
}
```

local variables

Variable Reassignment: Under the Hood (4/5)

```
public class PetShop {  
  
    /* This is the constructor! */  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
        django = new Dog();//old ref garbage collected  
        groomer.groom(django);  
    }  
}
```

Variable Reassignment: Under the Hood (5/5)

```
public class PetShop {  
  
    /* This is the constructor! */  
    public PetShop() {  
        this.testGroomer();  
    }  
  
    public void testGroomer() {  
        Dog django = new Dog();  
        DogGroomer groomer = new DogGroomer();  
        groomer.groom(django);  
        django = new Dog();    //old ref garbage collected  
        groomer.groom(django);  
    }  
}
```
