⇒ Linear Circuits

$x \rightarrow \boxed{\text{system}} \rightarrow y$

input — output

system is linear if

$Kx \rightarrow \boxed{\text{sys}} \rightarrow Ky$

where k is constant

"R" Resistor: linear element ✓
$V = iR$

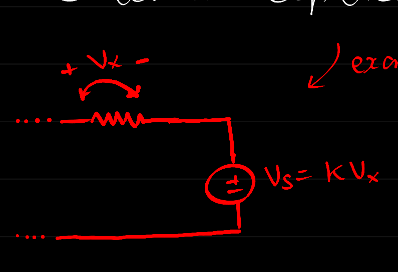
"L" Inductor: linear element ✓
$V = L\frac{di}{dt}$

"C" Capacitor: linear element ✓
$i = C\frac{dv}{dt}$

* Linear Electric circuits:

consists of ⇒

1. R, L, C → linear elements
2. Independent voltage & current sources
3. linear dependent sources



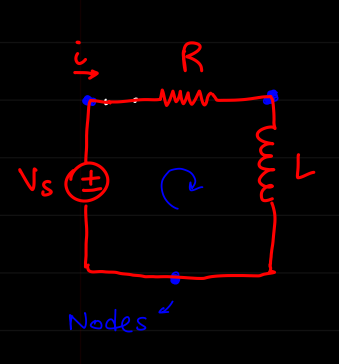
example
would not have been linear if $V_s = KV_x^2$

NOTE: diode and transistors are non-linear elements

* Response of a linear circuit

① full response = transient response + Steady State

transient response	Steady State
temporary	persists $t \to \infty$
due to sudden change	due to source
also called natural response	also called forced response
depends on linear elements R, L, C	depends on current/voltage source



KVL : $-V_s + iR + L\frac{di}{dt} = 0$

$i_{final} = i_{transient} + i_{steady\ state}$

as $t \to \infty$, $i_{final} = i_{steady\ state}$

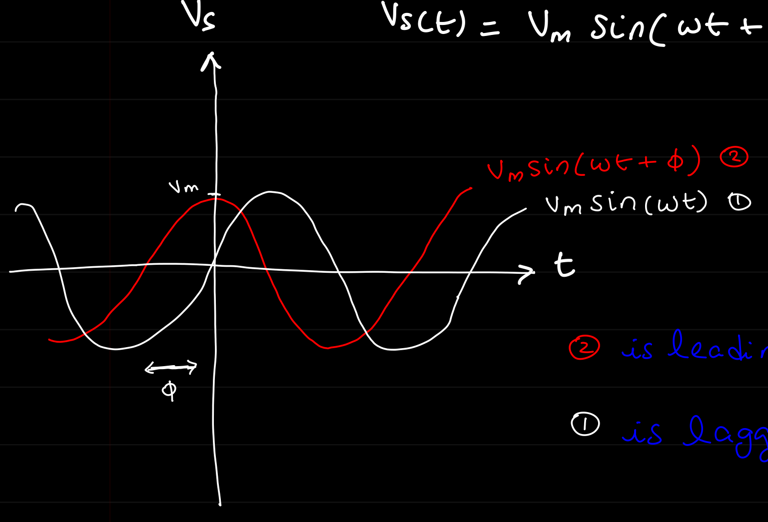
* Sinusoids & complex numbers

sinusoidally varying voltage source

$V_s(t) = V_m \cos(\omega t)$

$V_s(t) = V_m \sin(\omega t)$

$V_s(t) = V_m \sin(\omega t + \phi)$



② is leading ①
① is lagging ②
by angle ϕ

* TRIGO

$\sin(-\theta) = -\sin(\theta)$

$\cos(-\theta) = \cos(\theta)$

$\sin(A+B) = \sin A \cos B + \cos A \sin B$

$\cos(A+B) = \cos A \cos B - \sin A \sin B$

sin +ve	All +ve
tan +ve	cos +ve

* Complex Numbers

Real : x

complex : $x + iy$

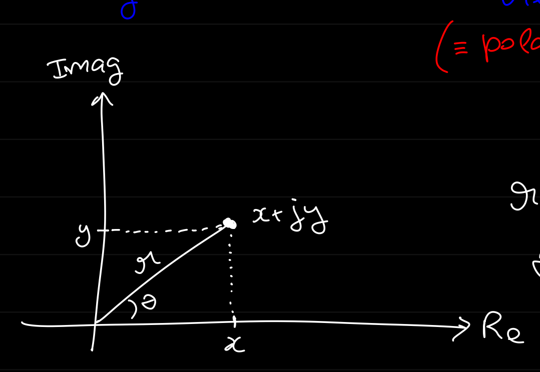
rectangular form; real part; imaginary part; $i = \sqrt{-1}$ a.k.a. j

⇒ **Euler's identity:** $e^{j\theta} = \cos\theta + j\sin\theta$

exponential form — rectangular form

Complex Number

- rectangular: $x + iy$
- exponential: $re^{j\theta}$ (≡ polar form : $r\angle\theta$)



$r = \sqrt{x^2+y^2}$

$\theta = \tan^{-1}\left(\frac{y}{x}\right)$

$$(r_1 e^{j\theta_1}) \times (r_2 e^{j\theta_2}) = (r_1 \cdot r_2)\, e^{j(\theta_1+\theta_2)}$$

AC	DC
• we can use transformers to vary voltage	• appliances need constant current
• transported easily over large distances

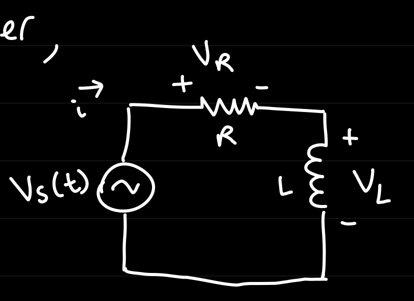
assuming transient has died out long back

Consider,



$V_s(t) = V_m \cos(\omega t)$
find $i(t)$

$V_s(t) = iR + L\frac{di}{dt}$

$\Rightarrow V_m \cos(\omega t) = iR + L\frac{di}{dt}$

both will take cos(wt) form

General form Solution : $i = I_1 \cos\omega t + I_2 \sin\omega t$

$\Rightarrow V_m \cos(\omega t) = (I_1 \cos\omega t + I_2 \sin\omega t)R + L\frac{di}{dt}$

$\frac{di}{dt} = \frac{d}{dt}(I_1 \cos\omega t + I_2 \sin\omega t)$

$\Rightarrow \omega(I_1(-\sin\omega t) + I_2 \cos\omega t)$

$\Rightarrow \omega(I_2 \cos\omega t - I_1 \sin\omega t)$

$V_m \cos(\omega t) = (I_1 \cos\omega t + I_2 \sin\omega t)R + (I_2 \cos\omega t - I_1 \sin\omega t)L\omega$

$\Rightarrow \cos\omega t \cdot (I_1R + I_2L) + \sin\omega t \cdot (I_2R - I_1L)$

$\Rightarrow (I_1R + I_2L - V_m)\cos(\omega t) + (I_2R - I_1L)\sin(\omega t) = 0$

* at $t = 0$,
$(I_1R + I_2L - V_m)\cdot 1 + (I_2R - I_1L)\cdot 0 = 0$

$\boxed{I_1R + I_2L = V_m}$

* at $t = \frac{\pi}{2\omega}$, $(I_1R + I_2L - V_m)\cdot 0 + (I_2R - I_1L)\cdot 1 = 0$

$I_1 = \frac{V_m L R}{R^2 + L}$ $\boxed{I_1 = I_2 \cdot \frac{R}{L}}$ $I_1R + I_2L = V_m \Rightarrow I_2\frac{R^2}{L} + I_2L = V_m \Rightarrow I_2\left(\frac{R^2+L}{L^2}\right) = V_m \Rightarrow I_2 = \frac{V_m L^2}{R^2+L}$

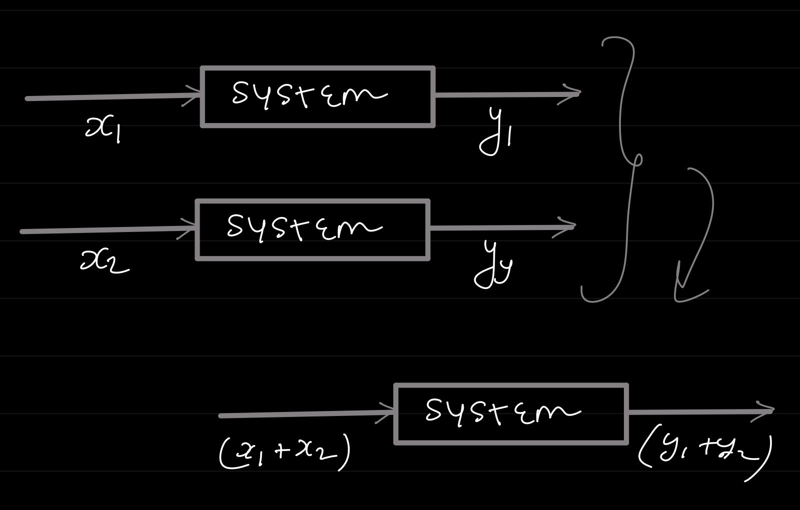
* Superposition principle

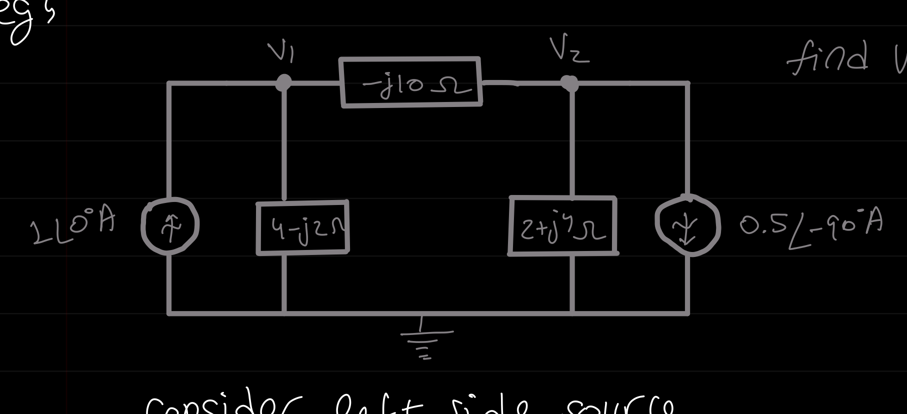
active elements : provide energy eg: volt src / curr src
passive element : consume / store energy eg: R/L/C



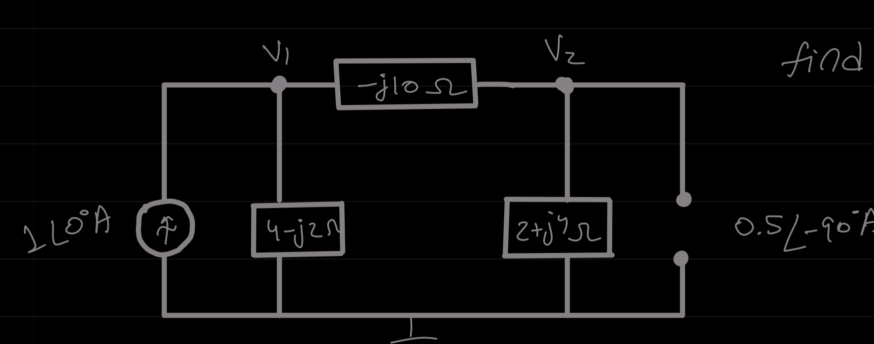
* Multiple independent sources

- consider separate independent sources "acting alone"
- add all responses

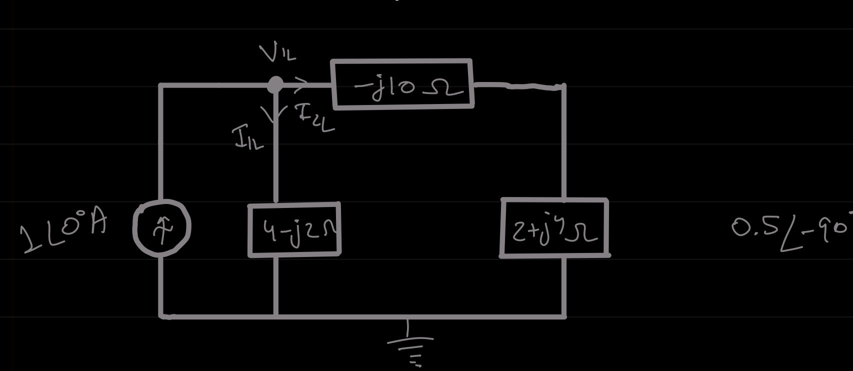
eg)



consider left side source
so we need to open the circuit at the right source



⇓



$V_{1L} = I_{1L}(4-j2)$

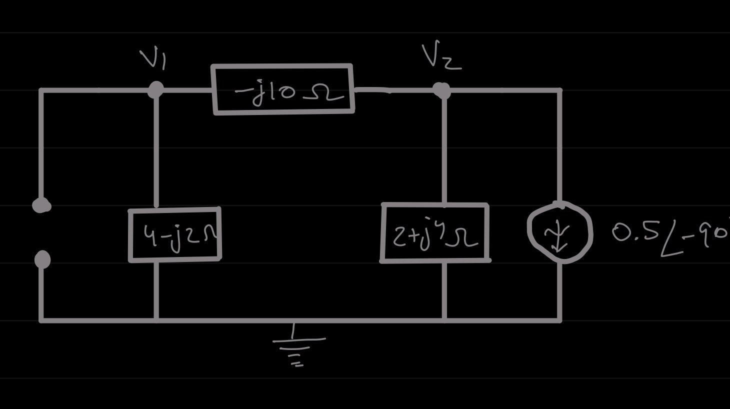
$\Rightarrow \dfrac{-j10+2+j4}{(4-j2)+(-j10+2+j4)}(4-j2)$

$\Rightarrow \dfrac{(2-j6)(4-j2)}{6-j8} \Rightarrow \dfrac{8-j4-24j-12}{6-8j}$

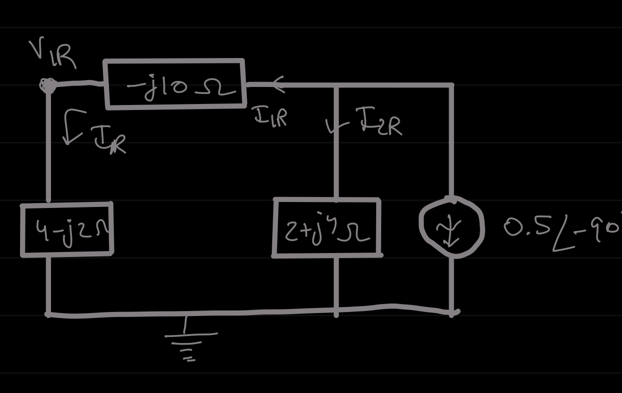
$\Rightarrow \dfrac{-4-28j}{6-8j} = 2-j2\,V$

$I_{1L}+I_{2L} = 1\angle0° = 1\cos0°+j1\sin0° = 1A$

consider right src



⇓



$V_{1R} = I_{1R}(4-j2)$

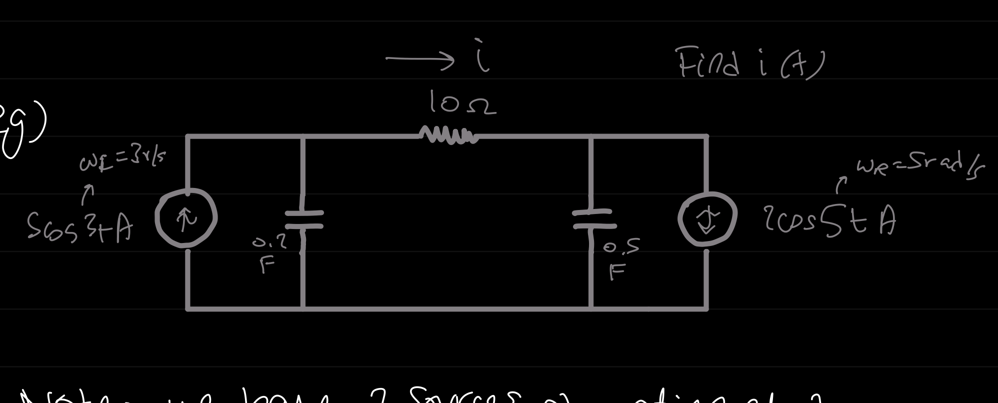
$I_{1R} = \dfrac{(-0.5\angle-90°A)(2+j4)}{-j10+4-2j+2+j4}$

$V_{1R} = \dfrac{(j\,0.5)(2+j4)(4-j2)}{6-j8}$

$\Rightarrow \dfrac{(j-2)(4-j2)}{6-j8} = \dfrac{j4+2-8+j4}{6-j8} = \dfrac{j8-6}{6-j8} = -1V$

$V_1 = V_{1L}+V_{1R} = 2-j2-1 = \boxed{1-j2\,V}$

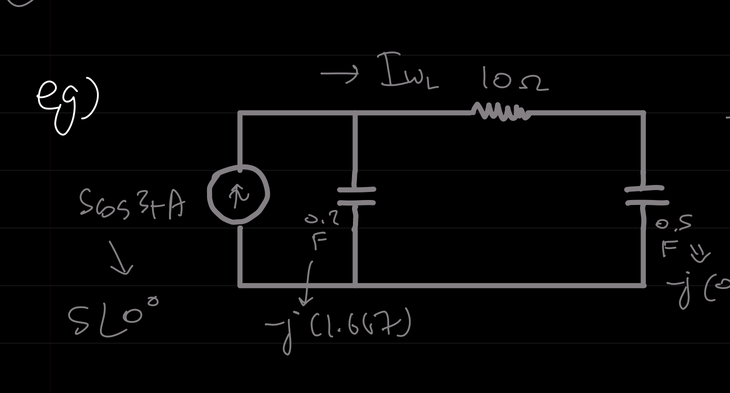
eg)



Note: we have 2 sources operating at 2 different frequencies (ω)

① consider left src $\omega_L = 3\,rad/s$

eg)

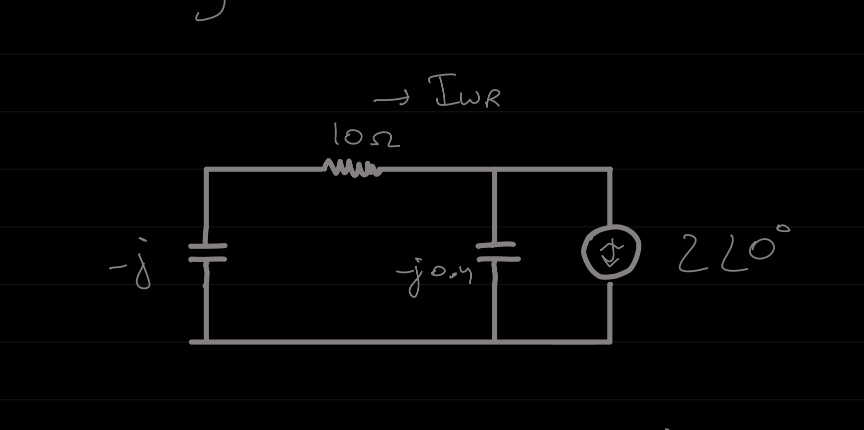


$\dfrac{1}{j\omega C} = \dfrac{1}{j(3)0.2} = \dfrac{-j}{0.6}$

$I_{WL} = 5\angle0°\left(\dfrac{-j(1/0.6)}{-j(1/0.6)+10+j(-1/0.6)}\right)$

$= 811.7\angle-78.81°\,mA$

② consider right source $\omega_R = 5\,rad/s$



$I_{WR} = 2\angle0°\left(\dfrac{-j\,0.1}{-j0.1+10+(-j)}\right)$

$= \dfrac{-j(0.2)}{-j(1.1)+10} = \dfrac{-j(0.2)[10+j1.1]}{100+1.21}$

$= \dfrac{-j2+0.22}{101.21}$

$= 0.0217\angle-82.03°\,A = 21.7\angle-82.03°\,mA$

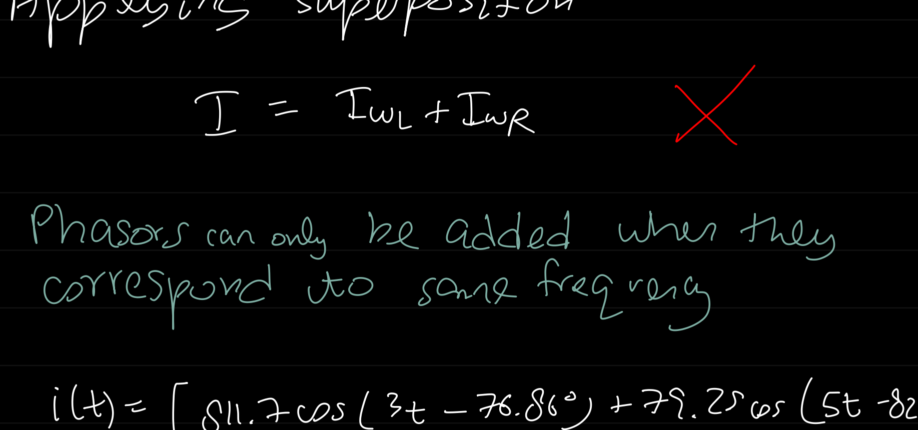
Applying superposition

$I = I_{WL}+I_{WR}$

Phasors can only be added when they correspond to same freq only

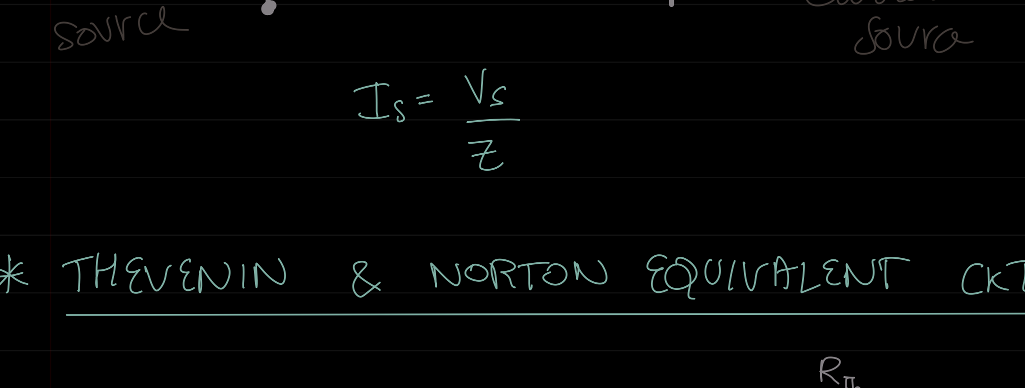
$i(t) = [811.7\cos(3t-78.81°)+21.7\cos(5t-82.03°)]\,mA$

* SOURCE TRANSFORMATION

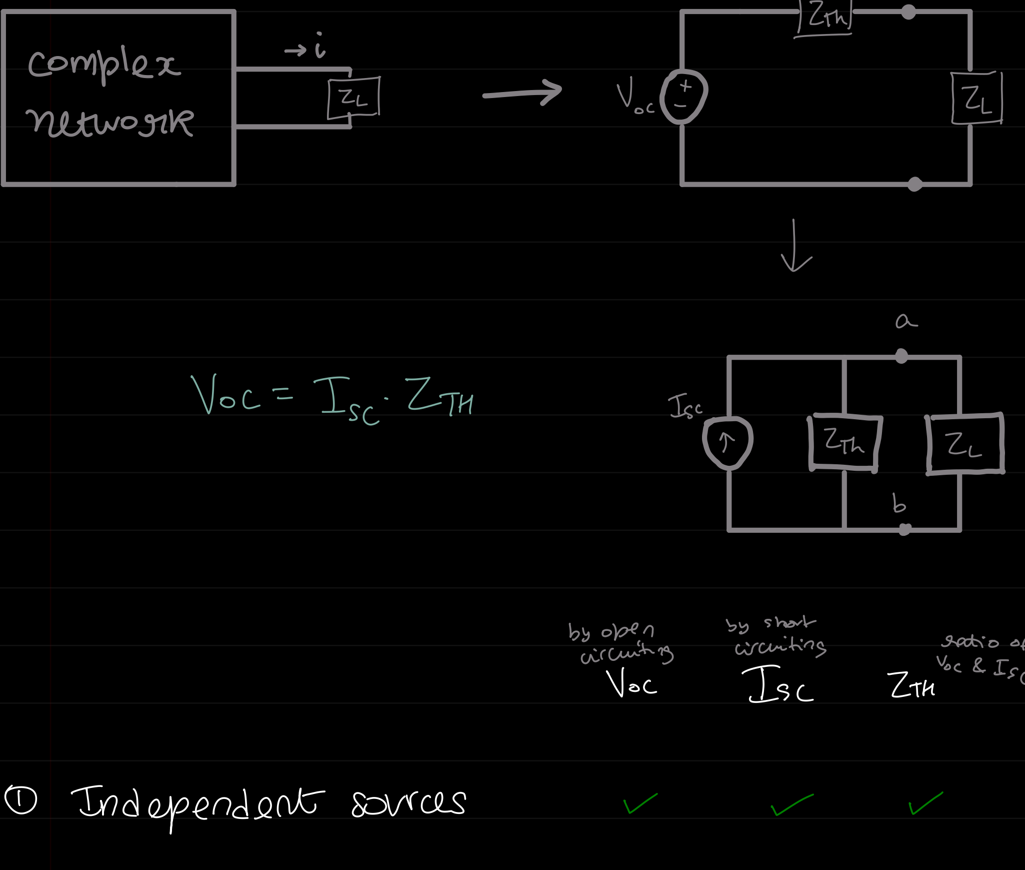


$I_s = \dfrac{V_s}{Z}$

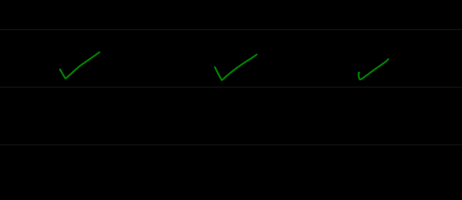
* THEVENIN & NORTON EQUIVALENT CKT



Normally



$V_{oc} = I_{sc}\,Z_{TH}$

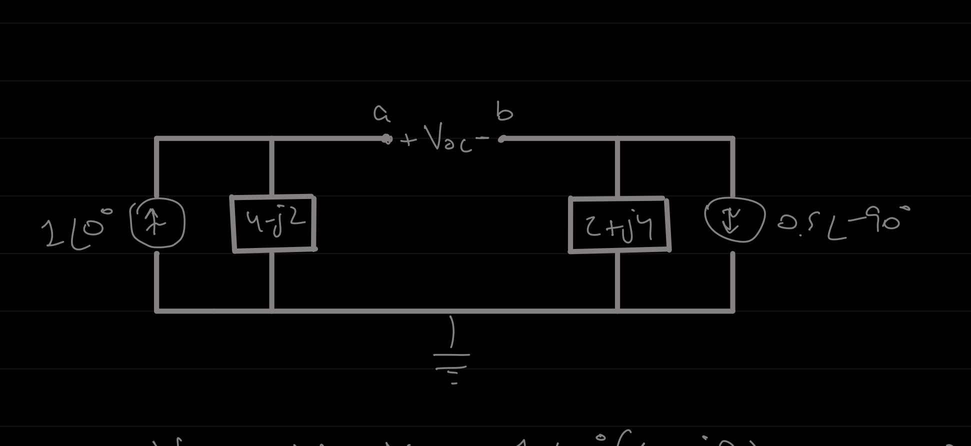


① Independent sources

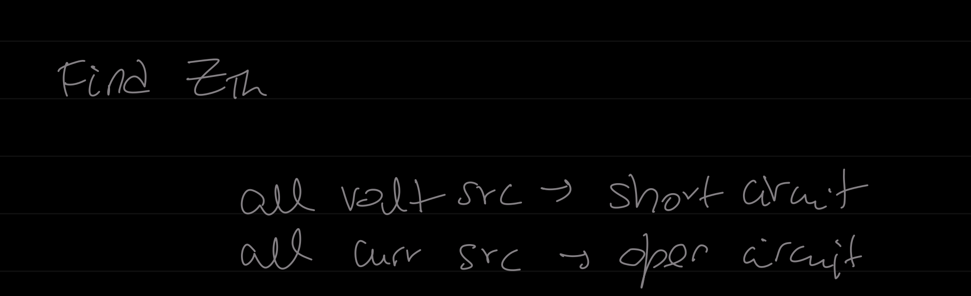
② Independent + dependent sources

③ Dependent sources only — We need to consider test source eg: 1A / 1V and then find $V_{oc} \div I_{sc} = Z_{TH} = \dfrac{V_{oc}}{I_{sc}}$

eg) find Thevenin equivalent seen by $-j10\,\Omega$



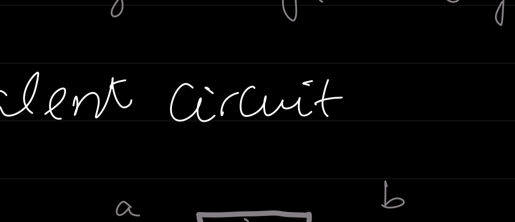
- : complex network
- : R_L



$V_{oc} = V_a - V_b = 1\angle0°(4-j2) - 0.5\angle-90°(2+j4)$
$= 4-j2+2-j1 = 6-j3\,V$

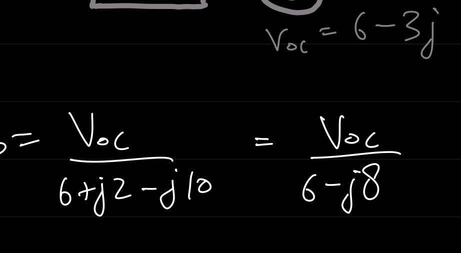
Find Z_{Th}

all volt src → short circuit
all curr src → open circuit



$Z_{TH} = 4-j2+2+j4 = 6+j2\,\Omega$

Equivalent Circuit



$I_{ab} = \dfrac{V_{oc}}{6+j2-j10} = \dfrac{V_{oc}}{6-j8}$

eg} $V(S) = \frac{7}{s} - \frac{31}{s + 17}$ find $v(t) = ?$

$$v(t) = \mathcal{L}^{-1}\{V(S)\} = 7\mathcal{L}^{-1}\left\{\frac{1}{s}\right\} - 31\,\mathcal{L}^{-1}\left\{\frac{1}{s+17}\right\}$$

$$v(t) = 7u(t) - 31 e^{-17t} u(t) = (7 - 31e^{-17t}) u(t)$$

• ZEROES & POLES

for some functions : $v(S) = \frac{N(S)}{D(S)}$

zeroes : Values of S that lead to numerator, $N(S) = 0$

Poles : Values of S that lead to denominator, $D(S) = 0$

eg : $v(S) = \frac{s - 3}{s(s + 6)}$

Zeroes : $s = 3$
Poles : $s = 0, -6$

eg} $v(S) = \frac{1}{(s + \alpha)(s + \beta)}$ find $v(t)$

convert to : $v(S) = \frac{A}{s + \alpha} + \frac{B}{s + \beta}$

↳ method of residue

$$\frac{1}{(s + \alpha)(s + \beta)} = \frac{A}{s + \alpha} + \frac{B}{s + \beta}$$

$$1 = A(s + \beta) + B(s + \alpha)$$

when $s = -\alpha \Rightarrow 1 = A(\beta - \alpha)$

$$A = \frac{1}{\beta - \alpha}$$

when $s = -\beta \Rightarrow 1 = B(\alpha - \beta)$

$$B = \frac{-1}{\beta - \alpha}$$

$$V(S) = \left(\frac{\frac{1}{\beta - \alpha}}{s + \alpha} \right) + \left(\frac{\frac{-1}{\beta - \alpha}}{s + \beta} \right)$$

$$v(t) = \frac{1}{(\beta - \alpha)} e^{-\alpha t} u(t) - \frac{1}{(\beta - \alpha)} e^{-\beta t} u(t)$$

$$= \frac{1}{(\beta - \alpha)} \left(e^{-\alpha t} - e^{-\beta t} \right) u(t)$$

eg} $I(S) = \frac{7s + 5}{s^2 + s}$ $\quad i(t) = ?$

zeroes : $\frac{-5}{7}$

poles : $0, -1$

$$I(S) = \frac{7s + 5}{s(s + 1)} = \frac{A}{s} + \frac{B}{s + 1}$$

$$A = \frac{1}{\beta - \alpha} = \frac{1}{1}, \quad B = \frac{-1}{\beta - \alpha} = -1$$

$$7s + 5 = A(s + 1) + B(s)$$

$$7s + 5 = (A + B)s + A$$

$A + B = 7 \Rightarrow B = 2$
$A = 5$

$$I(S) = \frac{5}{s} + \frac{2}{s + 1}$$

$$\mathcal{L}^{-1}(I(S)) = 5u(t) + 2e^{-t} u(t)$$

⇒ Repeated Poles

$$F(S) = \frac{2}{s^3 + 12s^2 + 36s} = \frac{2}{s(s^2 + 12s + 36)}$$

$$F(S) = \frac{2}{s(s + 2)^2}$$

$$F(S) = \frac{A}{s} + \frac{B}{s + 2} + \frac{C}{s + 2}$$

if we try to solve like earlier, we get inconsistent eqns like $2 = 0$

for repeated poles :

$$v(S) = \frac{N(S)}{(s - p)^n}$$

$$v(S) = \frac{a_n}{(s - p)^n} + \frac{a_{n-1}}{(s - p)^{n-1}} + \frac{a_{n-2}}{(s - p)^{n-2}} + \dots \frac{a_1}{(s - p)}$$

$$F(S) = \frac{A}{s} + \frac{B}{(s + 6)^2} + \frac{C}{(s + 6)}$$

$$2 = A(s + 6)^2 + B(s) + C(s)(s + 6)$$

when $s = 0 \Rightarrow 2 = 36A \Rightarrow A = \frac{1}{18}$

when $s = -6 \Rightarrow 2 = -6B \Rightarrow B = -\frac{1}{3}$

differentiate to find C

$$2 = A(s + 6)^2 + Bs + Cs(s + 6)$$

$$\frac{d(2)}{ds} \Rightarrow 0 = 2A(s + 6) + B + C(s + 6) + Cs$$

$\Rightarrow s = -6 \Rightarrow 0 = B + C(-6)$

$$C = \frac{B}{6} = \frac{-1}{18}$$

So, $A = \frac{1}{18}$, $B = \frac{-1}{3}$, $C = \frac{-1}{18}$

$$F(t) = \frac{1}{18} u(t) - \frac{1}{3} (t e^{-6t} u(t) - \frac{1}{18} e^{-6t} u(t)$$

• THEOREMS :

① Time differentiation theorem

$$f(t) \rightleftharpoons F(S)$$

$$\boxed{\frac{d}{dt} f(t) \rightleftharpoons sF(S) - f(0^-)}$$

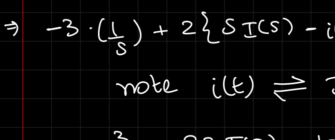
$\frac{L\,di}{dt} \to j\omega L I = sLI$
↳ when $\sigma = 0$

② Time Integration theorem

$$f(t) \rightleftharpoons F(S)$$

$$\int_{0^-}^{t} f(t)\,dt \rightleftharpoons \frac{F(S)}{S}$$

eg}



$i(t) = ?$

$i(0^-) = 5A$

KVL? $\Rightarrow -3u(t) + 2\frac{di}{dt} + 4i(t) = 0$

then integrate
but better way → Laplace

we cant use phasors because source ≠ sinusoidal
and we have a transient from $i(0^-) = 5A$

$$\Rightarrow -3 \cdot \left(\frac{1}{s} \right) + 2\{ sI(S) - i(0^-) \} + 4I(S) = 0$$

note $i(t) \rightleftharpoons I(S)$

$$-\frac{3}{s} + 2sI(S) - 10 + 4I(S) = 0$$

$$I(S) = \frac{\frac{3}{s} + 10}{2s + 4} = \frac{10s + 3}{2s^2 + 4s}$$

$$= \frac{A}{2s} + \frac{B}{s + 2}$$

$$10s + 3 = As + 2A + 2Bs$$

$$10s + 3 = s(A + 2B) + 2A$$

$A = \frac{3}{2}$, $\quad A + 2B = 10$

$$B = \frac{17}{4}$$

$$\Rightarrow I(S) = \frac{3/2}{2s} + \frac{17/4}{s + 2} \Rightarrow i(t) = ?$$

$$i(t) = \frac{3}{4} u(t) + \frac{17}{4} e^{-2t} u(t) \checkmark$$

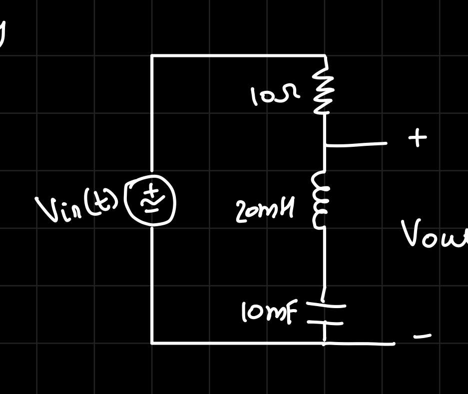
• Phasor vs S-domain

Assumptions:
zero initial conditions
sinusoidally varying source
"steady state"

time domain	freq. domain
$v(t) = V_m \cos(\omega t + \theta)$ $= Re\{V_m e^{j\omega t} e^{j\theta}\}$	$V = V_m e^{j\theta}$
$v(t) = V_m e^{\sigma t}\cos(\omega t+\theta)$ $= Re\{V_m e^{\sigma t} e^{j\theta} e^{j\omega t}\}$	$V = V_m e^{j\theta}$ where $s = \sigma + j\omega$ complex frequency
R	R
L	$L(\sigma + j\omega) = sL$
C	$\frac{1}{(\sigma+j\omega)C} = \frac{1}{sC}$

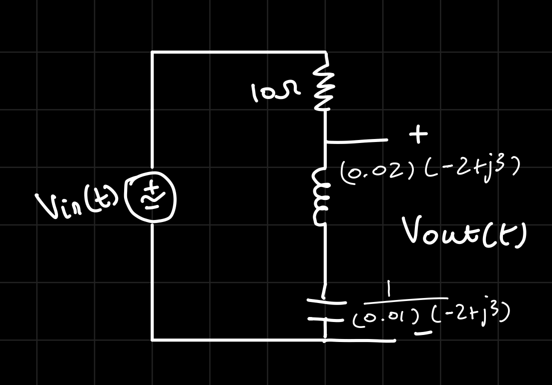
eg}



$V_{in}(t) = 5e^{-2t}\cos(3t+45°)$

$s = \sigma + j\omega$
$s = -2 + j3$

$V_{in} = 5e^{j45} = 5\angle 45°\ V$



Voltage divider for finding Vout

$$V_{out} = \frac{5\angle 45° \times (0.02)(-2+j3) \times \frac{1}{(0.01)(-2+j3)}}{10 + (0.02)(-2+j3) + \frac{1}{(0.01)(-2+j3)}}$$
$$= 5.86\angle -24.4$$

$$V_{out}(t) = Re\{5.86 e^{j(-24.4)} e^{(\sigma+j\omega)t}\}$$
$$= 5.86 e^{-2t}\cos(3t - 24.4)\ V$$

for zero initial condition, we can use phasors for $e^{\sigma t}\cos(\omega t+\theta)$

Can we still use phasors for $\delta(t)$, $u(t)$, $\sin(\omega t)u(t)$
